**INTRODUCTION**  
Retinoblastoma is a highly curable neoplasm in high-income countries, where patient survival exceeds 99%, making it the most curable of all pediatric cancers. In striking contrast, in many lower-income countries, most patients present with disseminated and metastatic disease, which is almost always fatal (1, 2).

In high-income countries, eye-sparing treatments have been used for decades. In the late 1990s there was an evolution in conservative treatment from local, eye-directed therapies such as external
